This cDNA sequence includes a claimed coding region that encodes bovine glucuronyl C5-epimerase (see W79263), an enzyme that catalyses the conversion of D-glucuronic acid (GlcA) to L-iduronic acid (IdoA). To isolate the sequence, highly purified epimerases from bovine liver was subjected to digestion with a lysine-specific protease. A DNA probe was generated from bovine liver cDNA by PCR using primers (see V62689-91) based on an isolated peptide (see W79270). This was used to screen a bovine lung lambda gt10 library, and a hybridising clone was identified and sequenced. An additional 12 bp of 5' sequence was obtained from a clone isolated from the library by PCR using an epimerase-specific primer (see V62692). The invention relates to isolated or recombinant DNA sequences for a mammalian (including human) glucuronyl C5-epimerase or its functional derivative. Recombinant expression vectors and transformed host cells are also claimed. The nucleic acid and vector can be used for the recombinant production of the enzyme. Glucuronyl C5-epimerase is useful for converting GlcA to IdoA in the biosynthesis of heparin and heparan sulphate.

XX Claim 1; Fig 9; 20pp; English.

The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an hereditary haemochromatosis (HH) affected individual. Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFE) gene mutation in an individual comprising:
(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence or absence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BRF genes, which are homologues of the milk protein butyrophilin (BR), and can be used in the production of agonists and antagonists of BR function. Also described are: (1) a Rokit gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can similarly be used for hypophosphatemia.

XX	in DNA profiling -
PS	Claim 22; Page 86; 11pp; English.
XX	

This sequence represents a human DNA marker clone used in the method of the invention. The method is for isolating a fragment of DNA containing an intermediate tandem repeat (ITR) sequence using hybridization selection, and comprises: (a) providing several DNA fragments, at least one of which contains an ITR sequence, a region of the DNA fragment which contains at least one repeat unit consisting of a sequence of five, six or seven bases repeated in tandem at least two times; (b) providing a stationary support having at least one oligonucleotide associated with it, where the oligonucleotide includes a sequence of nucleotides which is complementary to a portion of the ITR sequence; and (c) combining the DNA fragments with the support under conditions where the DNA fragments including the DNA fragment containing the ITR sequence hybridize to the support. The method is particularly used to isolate DNA containing pentanucleotide tandem repeat sequences as well as to detect target ITR DNA sequences having a low incidence of stutter artifacts (no more than 2.4%). The method is useful in DNA profiling for forensic analysis, criminal justice, paternity testing and other forensic and medical uses. DNA typing is also useful for confirming the lineage of horses, dogs and other prize animals. The invention overcomes problems related to the use of microsatellite loci in DNA profiling. The method can detect polymorphisms with a low incidence of stutter artifacts, which has previously been a problem in interpreting allelic content of loci. The development of markers based on larger repeat units, enables easier separation of the fragments on electrophoretic gels. This allows the simultaneous analysis of more loci.

PS Claim 1; Page 387; 453pp; English.
XX
CC The invention relate to the isolation of genes C69084-C69119 encoding
CC 27 human secreted proteins B37984-B38019. The genes can be used to
CC generate fusion proteins by linking to the gene for the human
CC immunoglobulin G Fc portion (C69075) for increasing the stability of
CC the fusion protein as compared to the human protein only. The genes and
CC proteins are useful for preventing, ameliorating or treating medical
CC conditions, e.g. by protein or gene therapy. The genes are isolated
CC from a range of human tissues disclosed in the specification. The
CC nucleic acids, proteins, antibodies and (ant)agonists are useful in
CC the diagnosis, treatment and prevention of: (a) cancer, e.g. breast
CC and ovarian cancer, and other cancers of the adrenal gland, bone, bone
CC marrow, breast, gastrointestinal tract, liver, lung, or urogenital;
CC (b) immune disorders e.g. Addison's disease, allergies, autoimmune
CC haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's
CC disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis;
CC (c) cardiovascular disorders such as myocardial ischaemias; (d) wound
CC healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy;
CC and (f) infectious diseases such as viral, bacterial, fungal and
CC parasitic infections.

XX Flea Malpighian tubule and head and nerve cord tissue derived nucleic

PS infestations -

XX Claim 26; Page 425; 964pp; English.

CC The invention relates to novel cat flea (Ctenocephalides felis) nucleic
CC acids which are expressed in hindgut and Malpighian tubule (HMT) tissue
CC or head and nerve cord (HNC) tissue. The invention also relates to the
CC encoded proteins. The invention additionally encompasses expression
CC constructs, recombinant viruses and recombinant cells comprising the
CC nucleic acids of the invention, recombinant production of the proteins,
CC antibodies against the proteins, a method of identifying inhibitors of
CC the proteins, and compositions comprising the inhibitors for
CC administration to an animal. The nucleic acids, and the proteins they
CC encode may be used in the prevention, treatment and diagnosis of diseases
CC associated with flea infestations. For example, the nucleic acids may be
CC used to produce an HMT or HNC protein according to standard recombinant
CC DNA methodology by inserting the nucleic acids into a host cell and
CC culturing the cell to express the protein. The HMT and HNC nucleic acids
CC may also be used as DNA probes in diagnostic assays (e.g., PCR) to detect
CC and quantitate the presence of cat flea or other homologous nucleic acid
CC sequences in samples. They may also be used to study the expression and
CC function of the proteins and their role in metabolism. The HMT and HNC
CC proteins may be used as antigens in the production of specific
CC antibodies, and in assays to identify modulators (agonists and
CC antagonists) of HMT and/or HNC protein expression and activity. The

CC anti-HMT/HNC protein antibodies and antagonists may also be used to
CC downregulate protein expression and activity. The antibodies may also be
CC used as diagnostic agents for detecting the presence of flea polypeptides
CC in samples (e.g., by enzyme linked immunosorbent assay (ELISA)). The
CC present sequence represents a cat flea HMT CDNA of the invention.

 XX
 CC This invention describes a novel nucleic acid molecule (1) encoding an
 CC alternan sucrose (E.C. 2.4.1.140 - an enzyme, that belongs to the
 CC glucosyltransferase group) The recombinant, purified alternan sucrose
 CC gene is useful for the fermentative production of alternan (a
 CC carbohydrate) and/or fructose by secreting the enzyme into a
 CC saccharose-containing culture medium. Alternatively, the enzyme is
 CC contacted with a saccharose-containing solution. The enzyme is
 CC fructose is then isolated from the medium. Cosmetic products or
 CC foodstuffs containing alternan can be produced. Recombinant production of
 CC alternan sucrose is advantageous as it provides a cost effective means of
 CC producing fructose for high fructose containing syrups, production of
 CC starch. This sequence represents a leuconostoc mesenteroides alternan
 CC sucrose protein encoding DNA insertion sequence which is described in the
 CC method of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE	Direct Submission
JOURNAL	Submitted (32-MAR-2000) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT	On Jul 3, 2000 this sequence version replaced g1:8079836.

* NOTE: This is a 'working draft' sequence. It currently
 * consists of 30 contigs. The true order of the pieces
 * is not known and their order in this sequence record is
 * arbitrary. Gaps between the contigs are represented as
 * runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence
 * as soon as it is available and the accession number will
 * be preserved.

1	1135:	contig of 1135 bp	in length

Project Information
Center project name: L10459
Center clone name: 82.G.5

Summary Statistics
Sequencing vector: M13; W7813; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 158402 bases at least Q40
Consensus quality: 165231 bases at least Q30
Consensus quality: 167603 bases at least Q20
Insert size: 168573; sum-of-contrigs
Quality coverage: 4.0 in Q20 bases; sum-of-contrigs

NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Direct Submission
Submitted (20-MAY-1999) Drosophila Genome Center, Lawrence Berkeley
Laboratory, MS 64-121, Berkeley, CA 94720, USA gi:4886670.
On Feb 21, 2000 this sequence version replaced gi:4886670.
For further information about this sequence, including its location
and relationship to other sequences, please visit our sequence
archive Web site (<http://www.fruitfly.org/sequence/>) or send email
to dbget@fruitfly.berkeley.edu. All contigs in this submission meet
the following cutoffs: length >= 200 bases.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 89 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

 The genome sequence of *Drosophila melanogaster*
 Science 287 (5461), 2185-2195 (2000)
 20196006
 2 (bases 1 to 299474)
 Adams,M.D., Celniker,S.E., Gibbs,R.A., Rubin,G.M. and Venter,C.J.
 Direct Submission
 Submitted (21-MAR-2000) Celera Genomics, 45 West Gude Drive,
 Rockville, MD, USA
 On Oct 9, 2000 this sequence version replaced gi:17302263.

 JOURNAL Submitted (25-JUN-1994) Nematode Sequencing Project, Sanger Centre, Hinxton, Cambridge CB10 1HQ, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA. E-mail: jess@sanger.ac.uk or tw@nemastode.wustl.edu
 COMMENT Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other available information.
 Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
 IMPORTANT: This sequence is not the entire insert of clone B0285. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
 The true left end of clone B0285 is at 25507 in sequence AL024499.
 The start of this sequence (1..104) overlaps with the end of sequence AL024499.
 The end of this sequence (41294..41387) overlaps with the start of sequence Z30973.
 Predicted proteins B0285.8, B0285.9 and B0285.10 are 60-70% identical at the amino acid level.
 For a graphical representation of this sequence and its analysis see: - http://wormbase.sanger.ac.uk/perl/ace/elegans/seq/sequence?name=B0285
 [000905 dl] Merged B0285.1 and B0285.2 based on EST data.

Summary Statistics
Assembly program: XGAP4, version 4.5
Sequencing vector: plasmid; L08752; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Consensus quality: 147428 bases at least Q40
Consensus quality: 150614 bases at least Q30
Consensus quality: 152462 bases at least Q20
Insert size: 154757; sum-of-contigs
Insert size: 151975; 15.3% error; agarose-fp
Quality coverage: 3.45x in Q20 bases; sum-of-contigs Quality
coverage: 3.61x in Q20 bases; agarose-fp
-----
* NOTE: This is a 'working draft' sequence. It currently
* consists of 16 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence

```

```

TITLE	1 (bases 1 to 167721)		
AUTHORS	Hall,R.		
JOURNAL	Direct Submission		
COMMENT	Submitted (07-NOV-2000) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk		
	requests: clonerequests@sanger.ac.uk		
	On Nov 10, 2000 this sequence version replaced gi:11121381.		
	During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.		
	This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.		
	The following abbreviations are used to associate primary accession		

numbers given in the feature table with their source databases:
 Em: EMBL; Sw: SWISSPROT; Tr: TREMBL; Wp: WORMPEP; Information
 on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
 was generated from part of bacterial clone contigs of human
 chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping
 Group. Further information can be found at
<http://www.sanger.ac.uk/Ref/Ch1>

Rp11-183M13 is from the library RP11-11.1 constructed at the
 Roswell Park Cancer Institute by the group of Pieter de Jong. For
 further details see <http://Dacpac.med.buffalo.edu/>
 VECTOR: pBACE3.6

This sequence is the entire insert of clone Rp11-183M13 The true
 left end of clone RPS-831021 is at 111240 in this sequence.
